## Introduction

Measurement of methylmalonic acid (MMA) is used as a specific diagnostic marker for the group of disorders known collectively called as methylmalonic acidemias
The metabolic pathway involves methylmalonyl-coenzyme $A(C o A)$ being converted into succinyl-CoA. Vitamin $B_{12}$ is also needed for this conversion. Therefore measurement of MMA can be used to diagnose a number of genetic disorders in this pathway and is elevated in $90-98 \%$ of patients with $B_{12}$ deficiency.
Typically the concentration of MMA is low and normally requires off-line extraction before analysis, however in these experiments a sensitive method was developed requiring minimal pre-treatment with just $10 \mu \mathrm{~L}$ sample injection to achieve suitable detection.

## Materials and methods

The LCMS-8030 triple quadrupole mass spectrometer was coupled to a Nexera UHPLC system. MMA was measured using a commercially available test kit ClinMass® Complete Kit for Methylmalonic Acid in Serum, Plasma and Urine, MS5000 (RECIPE Chemicals + Instruments GmbH, Dessauerstraße 3, 80992 München, Germany). Chemical standards, control samples, analytical column and mobile phase solvents were provided by the kit. $100 \mu \mathrm{~L}$ of sample was added to $400 \mu \mathrm{~L}$ of precipitant solution (containing internal standard). Following centrifugation $10 \mu \mathrm{~L}$ of supernatant was analysed.
For analysis the $[\mathrm{M}-\mathrm{H}]$ - ion was measured and used as the precursor ion (negative electrospray ionization).

## Analytical Conditions

## UHPLC:

 Nexera UHPLC$0.8 \mathrm{~mL} / \mathrm{min}$ starting at $20 \% \mathrm{~B}$
Injection volume: $\quad 10 \mu \mathrm{~L}$
Column temperature: $\quad 30^{\circ} \mathrm{C}$
Mass spectrometer: LCMS-8030
Source conditions: Desolvation Line:
$275^{\circ} \mathrm{C}$
Heat Block:
Nebulizer Gas:
Drying Gas:
有
Dwell time:
Pause time:

Ionization: Electrospray ionization (ESI), negative mode.
Scan Type: Multiple-reaction-monitoring mode (MRM)

Table 1 LC parameters were chosen for rapid compound elution and fast analysis time.

| Time <br> $(\mathrm{min})$ | Mobile Phase A <br> $(\%)$ | Mobile Phase B <br> $(\%)$ | Flow rate <br> $(\mathrm{mL} / \mathrm{min})$ |
| :---: | :---: | :---: | :---: |
| 0 | 80 | 20 | 0.8 |
| 0.01 | 10 | 90 | 0.8 |
| 1.6 | 10 | 90 | 0.8 |
| 1.61 | 80 | 20 | 0.8 |
| 2.3 | 80 | 20 | 0.8 |
| 2.31 | 80 | 20 | 1.4 |
| 2.75 | 80 | 20 | 1.4 |
| 2.8 | 80 | 20 | 0.1 |

Fig. 1 LC-MS separation of MMA and deuterated standard in under three minutes by fast chromatography.

Table 2 MMA optimized MRM transitions, retention time (RT). $\mathrm{T} / \mathrm{I}=$ target or internal standard

| Compound <br> $\boldsymbol{d}$ |  | Formula | MRM1 | MRM2 | RT |
| :--- | :--- | :--- | :--- | :--- | :--- |
| MMA | T | C4H604 | $117.1>73.2$ | $117.1>55.2$ | 1.63 |
| D3-MMA | I | C4H3D304 | $120.1>75.9$ | - | 1.63 |

## Application

## Data Sheet

## Results

The rapid separation of MMA produced good peak shape and was eluted in less than two minutes.
The calibration curve showed good linearity over a clinically relevant range 26.1-177 $\mu \mathrm{g} / \mathrm{L}$ (Fig. 2).
Two patient samples were anlaysed and measured in duplicate yielding MMA concentrations of $26.7 \mu \mathrm{~g} / \mathrm{L}$ and $65.7 \mu \mathrm{~g} / \mathrm{L}$, respectively. The replicate analyses achieved good analytical reproducibility at less than $5 \%$ relative standard deviation.

Fig. 2 Calibration curve for methylmalonic acid (concentraion range 26.1-177 $\mu \mathrm{g} / \mathrm{L}$ ).

## Conclusion

The application of the clinical ClinMass® Complete Kit for Methylmalonic Acid in Serum, Plasma and Urine proved simple to implement and showed good sensitivity and linearity in a clinically relevant concentration range.
